(54) COSMETIC CONTAINER

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a cosmetic container capable of meeting a request to prevent a decorated part from being partly peeled off or falling off a container body or a lid body, and capable of enhancing the flexibility to allow a purchaser to select the outer appearance as the purchaser likes.

SOLUTION: The cosmetic container comprises the container body and the lid body 6 for opening/closing the container body. The cosmetic container also has an interchangeable cover 7 releasably mounted to cover the lid body 6. The lid engagement part consisting of a recess 19 and a projection 20 is mounted between the lid body 6 and the interchangeable cover 7 to slidably engage the lid body 6 and the interchangeable cover 7, and a lock part consisting of a lock projection 22 mounted between the lid body 6 and the interchangeable cover 7 for locking the lid body 6 and the interchangeable cover 7 detachably in the sliding direction of the interchangeable cover 7 to hold the interchangeable cover 7 to the lid body 6.

CLAIMS

[Claim 1]

In the cosmetics container which has a body of a container, and the lid which open and close this.

Covering for exchange of the above-mentioned lid and the above-mentioned body of a container with which covers these to either and it is equipped exchangeable at least, The slide engagement section which it is prepared [section] between the above-mentioned lid or the above-mentioned body of a container, and the above-mentioned covering for exchange, and makes this covering for exchange engage with these lid or the body of a container free [a slide]. The cosmetics container characterized by having the stop section which stops these both free [engaging and releasing in the slide direction of this covering for exchange], in order to be prepared between the above-mentioned lid or the above-mentioned body of a container, and the above-mentioned covering for exchange and to make this covering for exchange hold on the lid concerned or the body of a container.

[Claim 2]

The cosmetics container according to claim 1 carry out that it is the stop projection which is equipped with the heights which are prepared in another side and inserted free [the side to this crevice], is prepared free [elastic deformation], for said stop section in the above-mentioned crevice, and is engaged free [engaging and releasing to the above-mentioned heights] either with the crevices where said slide engagement section was prepared in either of the coverings for said lid or the body of said container, and said exchange along the slide direction as the description.

[Claim 3]

The cosmetics container according to claim 2 with which said crevices and said heights are characterized by preparing the notching section for inverting the above-mentioned heights in the above-mentioned crevice free [insert and remove] at this while being suitably prepared in a location of the slide direction of said covering for exchange.

DETAILED DESCRIPTION

[Detailed Description of the Invention]

[0001]

[Field of the Invention]

This invention relates to the cosmetics container which can raise the degree of freedom as which it can respond to the request that that it is also partial separates and a decoration part falls out, neither from the body of a container, nor a lid, and a purchaser can choose an appearance again according to liking.

[Description of the Prior Art]

Generally, a cosmetics container is equipped with the body of a container which contains cosmetics, and the lid which opens this body of a container, or is closed, and is constituted. And appearance of a cosmetics container, decoration is given by various approaches from the former. For example, and the pattern etc. was attached upwards using the imprint, sheet, transparent and a translucent layer or a piled [an alphabetical character or pattern, etc. are imprinted or], and it is made to ornament at the body of a container, or a lid [that supporting etc. performs surface treatment].

[0002]

[Problem(s) to be Solved by the Invention]

By the way, it is the purpose of the cosmetics container as a product in the high quality which is full of a high-class feeling, if it is in the conventional cosmetics container, that it is also — partial separates and a part falls out neither from the body of a container, nor a lid — as the above — even if it was in which decoration approach, separation impossible had mutually the request that it had to form in one so that a decoration part might become really irremovable of the body of a container, or a lid.

[0003]

[Problem(s) to be Solved by the Invention]

Such a request meant that the appearance of a cosmetics container was limited to the design which the producer selected on the other hand, and the purchaser had barred enabling it to choose the design appearance of a cosmetics container freely according to liking. For this reason, a purchaser cannot find the cosmetics container of the design included in mind, but is considered that this had become the cause of restraint from buying.

[0004]

It aims at offering the cosmetics container which can raise the degree of freedom as which this invention can be originated in view of the above-mentioned conventional technical problems and it can respond to the request that that it is also partial separates and a decoration part falls out neither from the body of a container, nor a lid, and a purchaser can choose an appearance again according to liking.

[0005]

Such a request meant that the appearance of a cosmetics container which can raise the degree of freedom as which this invention can be originated in view of the above-mentioned conventional technical problems and it can respond to the request that that it is also partial separates and a decoration part falls out neither from the body of a container, nor a lid, and a purchaser can choose an appearance again according to liking.

[0006]

It aims at offering the cosmetics container which can raise the degree of freedom as which this invention can be originated in view of the above-mentioned conventional technical problems and it can respond to the request that that it is also partial separates and a decoration part falls out neither from the body of a container, nor a lid, and a purchaser can choose an appearance again according to liking.

[Means for Solving the Problem]

In the cosmetics container with which the cosmetics container concerning this invention has a body of a container, and the lid which open and the closes this covering for exchange of the above-mentioned lid and the above-mentioned body of a container which covers these to either and it is equipped exchangeable at least. The slide engagement section which it is prepared [section between the above-mentioned lid or the above-mentioned body of a container, and the above-mentioned covering for exchange, and makes this covering to exchange engage with these lids or the body of a container free [a slide]. In order to be prepared between the above-mentioned lid or the above-mentioned body of a container, and the above-mentioned covering for exchange and to make this covering for exchange hold on the lid concerned or the body of a container, it is characterized by having the stop section which stops these both free [engaging and releasing in the slide direction of this covering for exchange]. It becomes possible to raise the degree of freedom as which it can respond to the request that that it is also partial separates and a decoration part falls out neither from the body of a container, nor a lid by this, and a purchaser can choose an appearance again according to liking.

[0007]

Moreover, it carries out that it is the stop projection which is equipped with the heights which are prepared in another side and is inserted free [the slide to this cravice], is prepared free [elastic deformation] for said stop section in the above-mentioned cravice, and is engaged free [engaging and releasing to the above-mentioned heights] either with the cravice where said side engagement section was prepared in either of the body of said covering for said lid or body of said container, and said exchange along the slide direction of the body of a container, and covering for exchange, and while being able to secure the stable operability, easy-ability of engaging and releasing actuation of heights by the elastic deformation of stop projection can be attained.

[0008]

Furthermore, said cravice and said heights are characterized by preparing the notching section for inserting the above-mentioned heights free [insert and remove] in the above-mentioned cravice at this, while being suitably prepared in a location of the slide direction of said covering for exchange. The thing of the slide direction performs suitably in a location becomes possible about insertion of the heights into the cravice to which it shows side actuation, a slide control input can be shortened, and facilitation of desorption actuation of covering for exchange can be attained.

[0009]

[Embodiment of the Invention]

Below, 1. suitable operation gestalt of the cosmetics container concerning this invention is explained with reference to an accompanying drawing at a detail. The defined body 3 of the container made of synthetic resin with which the cravice 2 was formed as the cosmetics container 1 concerning this operation gestalt was shown in drawing 1 — drawing 3. While connecting with the body 3, order of length direction back and of a container free [the rotation to the vertical direction] through a hinge 4 and opening and closing the body 3 of a container The lid 6 made of the synthetic resin of the shape of a board which engages with the front end of the body 3 of a container free [engaging and releasing] through hook 5, and maintains the closedown condition of the body 3 of a container concerned. If it is in either and the example of illustration even if there are few lid 6 and bodies 3 of a container, a lid 6 is equipped free [attachment and detachment], and a lid 6 mainly consists of coverings 7 for exchange made of wrap-board-like synthetic resin exchangeable.

[0010]

The quality of the material of the covering 7 for exchange may be not only the product made of synthetic resin but metal. Moreover, the covering 7 for exchange covers the body 3 of a container, and it may be prepared, and may be prepared for the both sides of a lid 6 and the body 3 of a container, if it is in the example of illustration, although, as for the covering 7 for exchange, the flat-surface appearance profile is formed in the body 3 of these containers, the lid 6, and the lid in the shape of a rectangle, you may be the shape of a polygon, and a circle configuration.

The mirror 8 is attached in the rear face of a lid 6.

[0012] Hook 5 consists of a projection 10 for a hook which protruded in the hollow 9 formed in the front end of the body 3 of a container, and a piece 11 of a hook which hangs from the front end of a lid 6 and engages with the projection 10 for a hook free [engaging and releasing]. Moreover, a hinge 4 consists of a hinge block 13 made to hang from the back end of a lid 6 is put, cover the places 12 of the hinge blocks 13, and a hinge pin 14 is inserted crosswise of the body 3 of a container [right-and-left] between the pieces 12 of a hinge by which the pair protrusion was carried out from the back end of the body 3 of a container.

[0013] If the cosmetics container 1 and the operation gasket 7 have the covering 7 for exchange, what various kinds of various decoration was given is prepared so that a purchaser can choose the design-appearance of a lid 6 freely according to liking. The decoration part, given to the covering 7 for these exchange is really formed in separation impossible in one individual by the approach of general common knowledge to the covering 7 for exchange so that it is also partial, may separate it, and it may not drop out. On a lid 6, the covering 7 for exchange covers this, piles it up, and it is suspended with it, if it expands according to the example of illustration, the covering 7 for exchange is made to hang toward a lid 6 except for the back end from the periphery, and the suspension section 15 is formed.

[0014] On the other hand, except for the back end, the lid 6 formed in tubular by considerable thickness is made to project from the peripheral-wall 6a lower limit from the method of the outside of horizontal, and the flange 18 in which the suspension section 15 of the covering 7 for exchange is formed is lid 6, it projects up in the back end, and a lid 6 upwards from top-free 6b of a lid 6, and a wall 17 forms in it — having — this — it stands and the back end of the covering 7 for exchange is contacted by the wall 17. Similarly, the suspension section 13 of the covering 7 front end for [0015] exchange is contacted by periphery-wall 6a of the lid 6 front end.

Thus, between the lids 6 and the coverings 7 for exchange which were constituted, the slide engagement section made to engage the covering 7 for exchange with a lid 6, enabling a free slide is prepared. The slide engagement section is put between peripheral-wall 6a of crosswise right and left, of a lid 6 between a flange 16 and the hood 10 projected by right, above [or of it, 1]. It consists of a crevice 19 surely prepared by lid length with the cross direction of the lid 6 which is the slide direction, and heights 20 which are prepared in suspension section 15 lower limit of crosswise right and left of the covering 7 for exchange by lid length shorter than a crevice 19.

[0016] If it is in this operation gasket, these crevices 19 and heights 20 are formed in the proper location of the slide direction of the covering 7 for exchange concerned to a lid 6 and the covering 7 for exchange. If it is in the example of illustration, although these crevices 19 and heights 20 separate a considerable distance mutually and are formed in the front end of each peripheral-wall 6a on either side and each suspension section 15, and back and side two places, at least one place may be three or more places. Moreover, these crevices 19 and heights 20 are engaged in the vertical direction with the relation of the external corner and internal corner by which angle attachment of the heights 20 was carried out in the vertical direction from the crevice 19, at pulling out impossible. Moreover, in order to insert heights 20 in the crevice 19 concerned free [insert and removed] in each crevice 19, the notching section 21 which makes lid top face 6b open for free passage from the front and side is formed, and, thereby, a crevice 19 formed in the notching section 21 and a single string as a character-like cavity. Therefore, heights 20 are inserted into a crevice 19 through the notching section 21, and the inside of a crevice 19 is further slid to them by the cross direction of a lid 6 between a hood 18 and a flange 16. [0017]

Furthermore, between a lid 6 and the covering 7 for exchange, in order to make the covering 7 for exchange hold to a lid 6, the stop section 7 which stops these both free [engaging and releasing] in the slide direction of the covering 7 for exchange] is prepared. If it is in this operation gasket, this stop section consists of stop projections 22 which are prepared free [elastic deformation] in a crevice 19, and stop heights 20 to slide free [engaging and releasing]. The stop projection 22 consists of an elastic piece 24 of the shape of a cantilever formed in the vertical direction possible [elastic deformation] and a projection 25 formed downward at the top of this elastic piece 24 by forming a slit 23 in a hood 18 by considerable die length toward the back end side of a lid 6 from the notching section 21.

[0018] By pushing up the elastic piece 24 through projection 25, the heights 20 inserted into the crevice 19 overcome the projection 25 concerned in the slide direction, are are stopped, or it secedes from them. If it is in the example of illustration, although the stop projection 22 is formed in the crevice 19 by the side of the front end of a lid 6, it may prepare in the crevice 19 by the side of the back end, and you may prepare in a front end and back end side separately by right and left, of a lid 6, and it may be further prepared in all the crevices 19.

[0019] If an operation of the cosmetics container 1 concerning this operation gasket is explained, in case the purchaser who purchased the cosmetics container 1 will exchange for the new covering 7 for exchange of other designs the covering 7 for exchange with which the lid 6 is equipped, the covering 7 for exchange is made to slide toward front. If the covering 7 for exchange is made to slide, heights 20 will secede from the stop projection 22 and will reach the front end of a crevice 19, if the covering 7 for exchange is pulled apart from a lid 6 in this condition, heights 20 will slip out from a crevice 19 through the notching section 21, and, thereby, can remove the covering 7 for exchange from a lid 6.

[0020] Subsequently, in case a lid 6 is equipped with the new covering 7 for exchange, heights 20 are inserted into a crevice 19 and the covering 7 for exchange on top of a lid 6, where heights 20 are doubled with the notching section 21. When the covering 7 for exchange is made to slide toward back after that by laying the covering 7 for exchange on top of a lid 6, where heights 20 are doubled with the condition that the slide inside of a crevice 19, and will overcome the stop projection 22, it will be stopped, and the suspension section 15 of the covering 7 for exchange was bid by this on the flange 16 of a lid 6. A lid 6 stands the back end of the covering 7 for exchange and the front end of the suspension section 15 are contacted by a wall 17 and the peripheral-wall 6a front end, and, thereby, a lid 6 can be piled up and equipped with the covering 7 for exchange.

[0021] If it is in the cosmetics container 1 concerning this operation gasket as explained above The slide engagement section which it is prepared [section] between the covering 7 for exchange with which covers this to a lid 6 and it is prepared, changeable, and a lid 6, and the covering 7 for exchange, and makes the covering 7 for exchange engage with a lid 6 free [a slide] and which consists of a crevice 19 and heights 20 in lid 6 to be prepared between a lid 6 and the covering 7 for exchange and to make this covering 7 for exchange hold to this lid 6 concerned. Since it had the stop section 7 which stops these both free [engaging and releasing] in the slide direction of the covering 7 for exchange] and which consists of stop projection 22 can exchange the covering 7 for exchange and the appearance of the cosmetics container 1 is limited to the design which the producer selected — there is nothing — as the cosmetics container 1 — a purchaser — living — responding — an appearance — a degree of freedom — it shall choose highly, whereby, attractiveness to consumers shall be raised [0022].

Moreover, as covering 7 for exchange, like the conventional lid etc. that it is also partial separable, and a decoration part does not fall out from the covering 7 for exchange, and the cosmetics container 1 as a product can be offered at the high quality which is full of a high-class feeling without the former and inferior that what is necessary is just to form the decoration part of each other in separation impossible in one really indissoluble thereto.

[0023] Moreover, description actuation of the covering 7 for exchange can be easily performed only mainly by the slide actuation of the slide engagement section which consists of a crevice 19 and heights 20. Furthermore, the crevice 19 in which the slide engagement section was prepared by the lid 6 along the slide direction. The heights 20 which are prepared in the covering 7 for exchange and inserted in a crevice 19 rear [a slide] are had, and constituted. Moreover, since the stop section was constituted from stop projection 22 which consists of an elastic piece 24 which can prepare free [elastic deformation] in a crevice 19, and engages with heights 20 free [engaging and releasing], and projection 25. By the crevice 19 and heights 20, slide actuation of a lid 6 and the covering 7 for exchange can be guided, and while the stable operability is secured, engaging-and-releasing actuation of heights 20 can also be easilyized by the elastic deformation of the stop projection 22.

[0024] Moreover, while forming a crevice 19 and heights 20 in the proper location of the slide direction of the covering 7 for exchange since the notching section 21 for inserting heights 20 in this free [insert and remove] was formed in the crevice 19. The thing of the slide direction performed suitably in a location can become possible about insertion of the heights 20 into the crevice 19 to which it shows slide actuation; a slide control input can be set up short, and facilitation of description actuation of the covering 7 for exchange can be attained.

[0025] By the way, what is necessary is to make it hang from the covering 7 for exchange, to form a slide protruding line, to constitute the slide engagement section, and just to include the stop section in this protruding line, while forming a slide concave in top-face 6b of a lid 6, when the flat-surface appearance profile of the covering 7 for exchange is made into the shape of a polygon, or a circle configuration at the body 3 of a container, a lid 6, and a list.

[0026] Although this was explained to the lid 6 taking the case of the case where the covering 7 for wrap exchange is formed enabling free attachment and detachment, exchangeable if it was in this operation part mentioned above. In forming the covering 7 for exchange in the body 3 of a container, the slide engagement section and the stop section are prepared between the body 3 or a container, and the covering 7 for exchange, and while preparing a crevice 19, and the stop projection 22 and the notching section 21 in either the body 3 of a container, or the covering 7 for exchange in this case, heights 20 are formed in another side.

[0027] Furthermore, although the cosmetics container 1 equipped with the hinge 4 or the hook 5 was illustrated and explained if it was in this operation part, of course, you may apply to the various containers or the type which detaches a lid 6 according to screw structure or path fitting structure not only to this but to the body 3 of a container.

[0028] [Effect of the Invention] Above, in short, if it is in the cosmetics container concerning this invention, the degree of freedom as which it can respond to the request that that it is also partially separates and a decoration part falls out, neither from the body of a container nor a lid, and a purchaser can choose an appearance again according to liking can be raised.
